Workshop on Uncertainty & Robustness in Deep Learning

July 17, 2020

## Problem Setting

- ▶ Data set  $\{\mathbf{x}_i, \mathbf{y}_i\}_{i=1}^m$  consisting of inputs  $\mathbf{x}_i \in \mathcal{X}$  and targets  $\mathbf{y}_i \in \mathcal{Y}$
- ▶ Inverse problem:  $\mathbf{x} = \mathbf{A}\mathbf{y} + \boldsymbol{\eta}$  where  $\mathbf{y} \in \mathbb{R}^n$  is the unknown signal of interest,  $\mathbf{A} \in \mathbb{R}^{m \times n}$  denotes the forward operator representing a physical measurement process, and  $\boldsymbol{\eta} \in \mathbb{R}^m$  is modelling noise in the measurements
- ▶ Prediction function  $\Phi: \mathcal{X} \rightarrow \mathcal{Y}$

## Goal

A high-resolution alarm system in output-space that is *post hoc*, *efficient*, *easy to interpret* and *effective*.

# Method: Interval Neural Network Uncertainty I

Figure 1: Schematic INN overview

## Method: Interval Neural Network Uncertainty II

For positive values of  $[\underline{\mathbf{x}}, \bar{\mathbf{x}}]^{(l)}$ , we can express the interval propagation as

$$\bar{\mathbf{x}}^{(l+1)} = \varrho \left( \min \left\{ \overline{\mathbf{W}}^{(l)}, 0 \right\} \underline{\mathbf{x}}^{(l)} + \max \left\{ \overline{\mathbf{W}}^{(l)}, 0 \right\} \bar{\mathbf{x}}^{(l)} + \bar{\mathbf{b}}^{(l)} \right)$$

$$\underline{\mathbf{x}}^{(l+1)} = \varrho \left( \max \left\{ \underline{\mathbf{W}}^{(l)}, 0 \right\} \underline{\mathbf{x}}^{(l)} + \min \left\{ \underline{\mathbf{W}}^{(l)}, 0 \right\} \bar{\mathbf{x}}^{(l)} + \underline{\mathbf{b}}^{(l)} \right)$$

These formulas can then be used in existing deep learning frameworks to optimize the bounds of the interval parameters via backpropagation and the following cost function:

$$\begin{aligned} \mathcal{L}(\underline{\Phi}, \bar{\Phi}) &= \sum_{i=1}^m \max\{\mathbf{y}_i - \bar{\Phi}(\mathbf{x}_i), 0\}^2 + \max\{\underline{\Phi}(\mathbf{x}_i) - \mathbf{y}_i, 0\}^2 \\ &\quad + \beta \cdot (\bar{\Phi}(\mathbf{x}_i) - \underline{\Phi}(\mathbf{x}_i)) \end{aligned}$$

# Method: Interval Neural Network Uncertainty III

## INN Perks

- ▶ **Modular:** Plug in a finished prediction function and get uncertainty features on top without retraining
- ▶ **Quick:** INNs scale linearly in the number of prediction DNN operations  $K$  with a constant factor of 2, in contrast to a factor of  $T \geq 10$  for [1]
- ▶ **Interpretable:** Interval values and analytic coverage bounds<sup>1</sup>  
$$\mathbb{P}(\underline{\Phi}(\mathbf{x}^*) - \lambda\beta < \mathbf{y}^* < \overline{\Phi}(\mathbf{x}^*) + \lambda\beta \mid \mathbf{x}^*) \geq 1 - \frac{1}{\lambda}$$
- ▶ **Effective:** ?

---

<sup>1</sup>On the training distribution, see Section 3 of the paper

## Failure Modes

- ▶ Adversarial Artifact Detection (AdvDetect)
- ▶ Atypical Artifact Detection (ArtDetect)
- ▶ Error Correlation (EC)

## UQ Methods

- ▶ Interval Neural Network (INN):

$$\mathbf{u}_{\text{INN}}(\tilde{\mathbf{x}}) = \overline{\Phi}(\tilde{\mathbf{x}}) - \underline{\Phi}(\tilde{\mathbf{x}})$$

- ▶ Monte Carlo dropout (MCDrop)[1, 3]:

$$\mathbf{u}_{\text{MCDrop}}(\tilde{\mathbf{x}}) = \frac{1}{T-1} \left( \sum_{t=1}^T \Phi_t(\tilde{\mathbf{x}})^2 - \frac{1}{T} \left( \sum_{t=1}^T \Phi_t(\tilde{\mathbf{x}}) \right)^2 \right)$$

- ▶ Mean and Variance Estimation (ProbOut)[4, 2]:

$$\mathbf{u}_{\text{ProbOut}}(\tilde{\mathbf{x}}) = \Phi_{\text{var}}(\tilde{\mathbf{x}})$$

# Experiments II

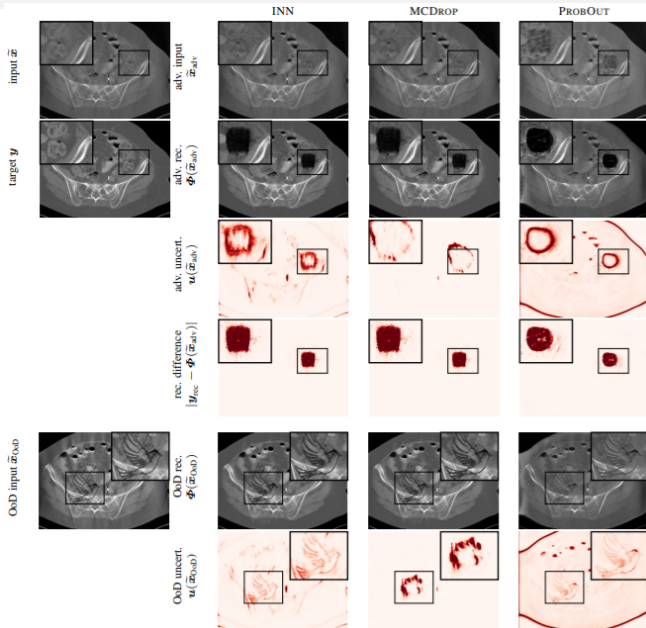

Figure 2: Results of three UQ methods for the AdvDetect and ArtDetect experiments. Plotting windows slightly adjusted for better contrast.

# Experiments III

**Table 1:** Mean test results ( $\pm$  standard deviation) averaged over three experimental runs. Pearson correlation coefficients for the Adversarial Artifact Detection and Atypical Artifact Detection experiments and PWCC with MSE for the EC experiment.

UQ Method	AdvDetect		ArtDetect		PWCC	EC	
	CT	Denoise	CT	Denoise		MSE	
INN	<b><math>0.56 \pm 0.05</math></b>	$0.77 \pm 0.008$	<b><math>0.52 \pm 0.03</math></b>	<b><math>0.69 \pm 0.006</math></b>	<b><math>2211 \pm 403</math></b>	$7.4 \pm 0.65 \times 10^{-4}$	
MCDrop	$0.28 \pm 0.02$	$0.20 \pm 0.001$	$0.26 \pm 0.01$	$0.44 \pm 0.02$	$2170 \pm 513$	$7.4 \pm 0.65 \times 10^{-4}$	
ProbOut	$0.48 \pm 0.12$	<b><math>0.81 \pm 0.002</math></b>	$0.34 \pm 0.04$	$0.44 \pm 0.01$	$190 \pm 28$	$6.7 \pm 2 \times 10^{-3}$	

- + The advertisements above
  - Dealing with INN activation functions other than ReLU
  - How can we incorporate batch normalization in the INN?
- ? Beyond inverse problems: classification
- ? Deeper probabilistic interpretation of INNs beyond ELBO and the approximate posterior <sup>2</sup>
- ? Application of INNs in DNN compression

deeper understanding of what uncertainties are capable and not capable of in DL -> that is exactly what motivated us to start, applications in DNN compression
